

What is claimed:

1. An apparatus for the sealing of punctures in and pumping up of a tire comprising:

a pressure-tight container having an outlet valve and containing a sealing preparation comprising natural rubber latex and an adhesive resin compatible with the natural rubber latex;

a source of pressure for introducing the sealing preparation from the pressure-tight container into an interior of the tire and for pumping up the tire; and

a source of heat for heating up the sealing preparation in the pressure-tight container and/or for heating up of the pressure source.

2. The apparatus of claim 1, wherein the source of pressure comprises a liquefied gas that is contained with the sealing preparation in the pressure-tight container.

3. The apparatus of claim 1, wherein the pressure-tight container has a gas inlet and the pressure source comprises an air compressor with which air under pressure can be introduced via the gas inlet into the pressure-tight container.

4. The apparatus of claim 1, wherein the pressure-tight container has a gas inlet and the pressure source comprises at least one pressure bottle that contains the liquefied or compressed gas that can be introduced via the gas inlet into the pressure-tight container.

5. The apparatus of claim 1, wherein the heat source comprises a heated cushion with resistance heating.

6. The apparatus of claim 1, wherein the heat source comprises at least two substances separated from one another and that release reaction heat when mixed.

7. The apparatus of claim 1, wherein the heat source is a latent heat store that releases heat when it is converted.

8. An apparatus for sealing punctures in and pumping up a tire comprising:

a pressure-tight container containing a sealing preparation comprising natural rubber latex and an adhesive resin compatible with the natural rubber latex and also containing liquefied sulfur hexafluoride as a pressure source for introducing the sealing preparation

out of the pressure-tight container into an interior of the tire and also for the pumping up of the tire;

an outlet valve for the sealing preparation; and

an outlet quantity restrictor.

9. An apparatus for sealing punctures and pumping up a tire comprising:

a pressure-tight container containing a sealing preparation comprising natural rubber latex and an adhesive resin compatible with the natural rubber latex;

an outlet valve for the sealing preparation;

a gas inlet; and

a pressure source with which gas under pressure can be introduced into the pressure-tight container via the gas inlet.

10. The apparatus of claim 9, wherein the pressure source is an air compressor.

11. The apparatus of claim 9, wherein the pressure source comprises at least one pressure bottle with liquefied or compressed gas.
